## Abstracts

Biomass is currently widely used as a fuel, but the biomass should be dried before use. Through the drying process, a large amount of water can be removed from the biomass. The reduced weight of biomass helps reduce processing costs as well as storage and transportation costs. Raw materials such as Sawdust and Bamboo Dust enter the Biomass Dryer and are dried by hot air, steam or hot water. Biomass Dryer typically includes heat generating units, drying units and air pollution control units. The downstream application of biomass dryer is the biomass energy industry. In the overall energy supply, fossil fuels such as coal, oil and natural gas still dominate in most countries. For example most Asian countries, Australia and South Africa. Over the past decade, the share of renewable energy in global energy consumption has increased year by year. Biomass accounts for more than half of renewable energy supply in most countries, with the exception of countries with relatively high hydropower resources. Biomass energy supply in Brazil and Finland has accounted for more than 30% of the total energy supply.

The global Biomass Dryer market size was estimated at USD 614.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.50% during the forecast period.
