## Abstracts

Biomass green methanol is methanol produced from biomass feedstocks, such as wood waste, agricultural residues, or dedicated energy crops. The process typically involves gasification of the biomass to produce syngas (a mixture of carbon monoxide, hydrogen, and carbon dioxide), followed by catalytic conversion of the syngas to methanol. Unlike conventional methanol production from fossil fuels, biomass green methanol offers a renewable and carbon-neutral pathway, as the CO<sub>2</sub> released during production is offset by the CO<sub>2</sub> absorbed by the biomass during its growth. The industry trend for biomass green methanol is experiencing growing interest due to the increasing focus on sustainable fuels and chemicals. Several factors are driving this trend. Firstly, there is a global push to reduce greenhouse gas emissions and dependence on fossil fuels, making biomass-derived fuels like green methanol an attractive alternative. Secondly, the availability of abundant biomass resources, including agricultural and forestry residues, provides a sustainable feedstock for methanol production. Thirdly, advancements in biomass gasification and catalytic conversion technologies are improving the efficiency and cost-effectiveness of green methanol production. The shipping industry is particularly interested in biomass green methanol as a potential low-carbon marine fuel to comply with stricter emissions regulations. It can also be used as a blending component in gasoline or as a fuel in dedicated methanol vehicles, contributing to decarbonizing the transportation sector. The chemical industry is also exploring the use of green methanol as a building block for producing various chemicals and materials, offering a more sustainable alternative to fossil-based feedstocks. Government policies and incentives supporting the development and deployment of renewable energy and bio-based technologies are further accelerating the growth of the biomass green methanol industry. The development of pilot and demonstration plants is crucial for validating the technology and scaling up production. Overall, the industry trend for biomass green methanol is positive, with increasing research, development,

and commercialization efforts paving the way for its wider adoption in various sectors.

The global Biomass Green Methanol market size was estimated at USD 122.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 16.70% during the forecast period.
