Biomass Pretreatment System refers to the processes and technologies used to modify the structure of biomass (such as agricultural waste, wood, or other organic materials) to enhance its suitability for conversion into biofuels or other valuable products. These systems typically involve physical, chemical, or biological methods that break down lignocellulosic biomass, increase the accessibility of cellulose and hemicellulose, and reduce the presence of lignin. The goal is to improve the efficiency of subsequent processing steps like fermentation or enzymatic hydrolysis, making biomass a more viable and sustainable alternative energy source.

The global Biomass Pretreatment System market size was estimated at USD 716.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.30% during the forecast period.
