Abstracts

Biomass pyrolysis oil, also known as bio-oil or pyrolysis liquid, is a dark brown, viscous liquid produced through the thermochemical decomposition of organic materials such as wood, agricultural residues, or energy crops in the absence of oxygen at elevated temperatures (typically 400-600°C). It is chemically complex, comprising a mixture of water, organic compounds (including acids, alcohols, ketones, and phenolics), and solid char particles, which results in properties like low pH, thermal instability, and immiscibility with petroleum fuels. While not directly substitutable for conventional fuels due to its corrosive nature and lower energy density, it serves as a renewable intermediate that can be upgraded for use as heating oil, converted into transportation fuels, or utilized as a chemical feedstock.

The global Biomass Pyrolysis Oil market size was estimated at USD 520.75 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 5.20% during the forecast period.
