Abstracts

Biomass Pyrolysis Plant is used to convert various types of biomass?such as wood chips, coconut shells, rice husks, and agricultural waste?into biochar (a form of charcoal) through a thermal decomposition process known as pyrolysis. Operating in an oxygen-limited environment, the machine heats biomass to high temperatures (typically 400?800?C), releasing volatile gases and leaving behind carbon-rich charcoal. The process improves biomass energy density, reduces waste volume, and produces by-products like wood vinegar and tar, which can be reused.

The global Biomass Pyrolysis Plant market size was estimated at USD 116.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 8.10% during the forecast period.
