Abstracts

A biomass steam generator is a specialized thermal energy system that utilizes organic materials?such as wood chips, agricultural residues, pellets, or other forms of biomass?as fuel to produce steam through combustion or gasification processes. This equipment is engineered to convert the chemical energy stored in biomass into heat, which is then transferred to water within a boiler system, generating high-pressure steam used for various industrial, commercial, or district heating applications. Key components typically include a biomass combustion chamber, heat exchanger, water feed system, and emissions control mechanisms to ensure efficiency and regulatory compliance. These generators are valued for their use of renewable fuel sources, reducing dependence on fossil fuels and lowering carbon footprints, while offering operational flexibility in sectors like manufacturing, food processing, and power generation where steam is a critical utility.

The global Biomass Steam Generator market size was estimated at USD 1230.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.45% during the forecast period.
