Report Overview:

A buffer solution is comprised of a weak conjugate acid-base pair, for example, a weak acid and its conjugate base, or a weak base and its conjugate acid. Small quantities of other acids or bases are neutralized when added to the solution, and as a result, the solution resists changes in pH. Solutions with stable pH are required for the processing of protein-based biologic APIs because of their sensitivity to changes in pH. The stable pH range and capacity (the amount of acid/base that can be added without a change in pH) of a buffer are determined by the conjugate acid-base pair.

Most purification steps for downstream processing of biologics require buffers to equilibrate, condition, wash, elute, or concentrate the product. They are used in product isolation and purification steps to facilitate protein capture and polishing and also in the filtration process for the removal of viruses or depyrogenation. Aqueous solutions are also required for cleaning and disinfecting downstream processing equipment, such as chromatography matrices and membrane filtration systems. The main equipment involved in downstream processing with buffers includes mixers for buffer preparation, as well as equipment for purification, including packed-bed chromatography systems, fluidized beds, ultrafiltration and diafiltration membranes, microfiltration membranes, depth filtration cartridges, and virus-removal systems.

The Global Biopharma Buffer Market Size was estimated at USD 875.87 million in 2023 and is projected to reach USD 1070.44 million by 2029, exhibiting a CAGR of 3.40% during the forecast period.
