Abstracts

To reduce plastic waste and tackle plastic pollution, an innovative packaging material made from sustainable and biodegradable materials is essential.Biopolymer-based packaging film, made from sustainable raw materials with a simplified end-of-life disposal, is one alternative packaging that can lead to a reduction in global dependency on fossil fuel resources for packaging.According to the ocean literacy portal of UNESCO, currently, there are about 50-75 trillion pieces of plastic and microplastics in the ocean. 80 percent of marine pollution is caused by plastic waste and around 8 to 10 million metric tons of plastic end up in the ocean each year. According to the Center for Biological Diversity, fish in the North Pacific ingest 12,000 to 24,000 tons of plastic each year. This causes intestinal injury and death and transfers plastic up the food chain to bigger fish, marine mammals, and human seafood eaters. As a result, the demand for zero waste packaging is projected to witness growth over the forecast period.

The global Biopolymer Material for Zero Waste Packaging market size was estimated at USD 72600.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 9.90% during the forecast period.
