Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Bioprocess Purification Packing Material competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Bioprocess purification packing material, also known as chromatography resin, is a key stationary-phase medium used in chromatographic columns for downstream processing. It consists of inert base matrix beads (e.g., agarose, polymer) functionalized with specific ligands. The resin interacts with target biomolecules (like proteins, nucleic acids, viruses) from a complex feedstock based on differences in their physicochemical properties (e.g., size, hydrophobicity, charge) or specific biological affinities (e.g., Protein A-IgG). This interaction enables the highly efficient separation, capture, and purification of the desired product from impurities, which is critical for achieving high yield and purity in biopharmaceutical manufacturing. In 2024, the global production of bio-purification packing materials reached 2.54 million liters, with an average selling price of US\$938 per liter. A typical single-line production capacity is approximately 50,000-100,000 liters, and the industry's gross profit margin is above 60%. Cost structure: Raw materials account for approximately 30%-40%, manufacturing costs account for approximately 40%-50%, and labor costs account for approximately 13%. Industry chain: Upstream consists of matrix materials (agarose, polymer microspheres, etc.) and functional ligands (recombinant protein A, ion exchange groups, etc.), while downstream applications are mainly in the biopharmaceutical industry.

The global Bioprocess Purification Packing Material market size was estimated at USD 2386.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.00% during the forecast period.
