Report Overview

Biopsy forceps are medical instruments designed for the procurement of tissue samples from various organs or tissues within the body. These forceps are typically used in minimally invasive procedures, such as endoscopic or percutaneous biopsies, to obtain samples for diagnostic purposes. They consist of a slender, elongated shaft with a handle at one end and a pair of jaws at the other. The jaws are designed to grasp and cut a small piece of tissue, which is then retrieved for further analysis. Biopsy forceps can be made from various materials, including stainless steel or plastic, and may be single-use or reusable, depending on the specific application and sterilization requirements. Their design may vary to accommodate different tissue types and anatomical locations, ensuring precise and efficient sampling while minimizing patient discomfort and risk of complications.
