Report Overview

The biopsy punch is a medical device designed for obtaining tissue samples from the skin or other superficial tissues for diagnostic purposes. It typically consists of a sharp, circular blade attached to a handle, allowing clinicians to excise a cylindrical tissue specimen with precision and minimal trauma. Biopsy punches are commonly used in dermatology, pathology, and surgical settings to diagnose conditions such as skin cancer, infections, or inflammatory diseases. Available in various diameters (ranging from 1mm to 10mm), these instruments can be disposable or reusable, with materials like stainless steel or plastic. The design ensures clean, uniform samples while reducing bleeding and scarring, making it a preferred tool for minimally invasive procedures. Technological advancements have introduced automated and semi-automated versions, improving efficiency and consistency in sample collection.
