Abstracts

Bioresorbable Metals Cardiovascular Stents are advanced medical devices made of biodegradable metal materials designed to provide temporary physical support for coronary artery lesions. Over time, these stents will be gradually absorbed by the body after completing their functions, avoiding late complications that may be caused by the long-term retention of traditional metal stents, such as stent thrombosis and restenosis. The ultimate goal of such a stent is to promote natural healing of the vessel and return the vessel to a state more similar to its natural state without the stent, thereby reducing long-term risk for the patient and improving quality of life.

The global Bioresorbable Metals Cardiovascular Stents market size was estimated at USD 1007.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 8.70% during the forecast period.
