Report Overview

Bioseparation Column is a technical equipment used for purification and separation of biological products (such as proteins, antibodies, enzymes, etc.). It is a columnar structure made of different materials, filled with materials with specific separation properties, such as affinity chromatography media, molecular sieves, etc. Bioseparation Column uses the interaction between biomolecules (such as affinity, charge, size exclusion, etc.) to achieve selective adsorption and elution of target biomolecules. By passing the sample solution to be processed into the separation column, the target biomolecules can be selectively adsorbed on the packing material in the column, while other impurity components are effectively removed.

The global Bioseparation Column market size was estimated at USD 879 million in 2023 and is projected to reach USD 1629.65 million by 2032, exhibiting a CAGR of 7.10% during the forecast period.
