Abstracts

Bipolar disorder drugs, also known as mood stabilizers, are a class of pharmaceuticals primarily used to manage and treat the symptoms of bipolar disorder, a chronic mental health condition characterized by alternating episodes of mania (or hypomania) and depression. These medications aim to stabilize mood, prevent relapse, and reduce the severity of manic, depressive, or mixed episodes. The category includes several types of drugs such as lithium, anticonvulsants (e.g., valproate, carbamazepine, lamotrigine), atypical antipsychotics (e.g., quetiapine, olanzapine, aripiprazole), and occasionally antidepressants when used cautiously in combination with mood stabilizers. The choice of medication depends on factors like the phase of the illness, side effect profiles, patient history, and comorbidities, and treatment often involves long-term or lifelong use to maintain stability, with ongoing adjustments based on efficacy and tolerability.

The global Bipolar Disorder Drugs market size was estimated at USD 7205.6 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 3.85% during the forecast period.
