## Abstracts

The bipolar Hall switch is a magnetically controlled switch based on the Hall effect, which consists of a Hall plate, a circuit board, and a magnet. It uses the alternating NS poles of the magnetic field to output signals, and usually needs to be turned on when the South Pole magnetic field strength is sufficient, and turned off when the North Pole magnetic field strength is sufficient. With the continuous development of industrial automation, consumer electronics, and automobiles, the market demand for bipolar Hall switches continues to grow. Especially in emerging markets such as new energy vehicles and smart homes, the application prospects of bipolar Hall switches are even broader. In order to meet the needs of different fields, the technology of bipolar Hall switches is constantly innovating. For example, improvements in improving sensitivity, reducing power consumption, and enhancing anti-interference capabilities have made the performance of bipolar Hall switches more superior. With the continuous expansion of the market, competition in the bipolar Hall switch industry has become increasingly fierce. Domestic and foreign manufacturers have increased their R&D investment and improved product quality and service levels in order to compete for market share.
