Abstracts

A bipolar plasma resectoscope is a specialized urological and gynecological surgical instrument used for minimally invasive procedures such as transurethral resection of the prostate (TURP) or endometrial ablation. It employs bipolar electrosurgical technology, where high-frequency electrical current passes between two closely spaced electrodes at the instrument's tip, generating a plasma field that enables precise tissue cutting, coagulation, and vaporization with enhanced hemostasis. Unlike monopolar systems, it uses saline irrigation instead of non-conductive fluids, eliminating the risk of stray currents and reducing complications like TUR syndrome. Its design allows for simultaneous resection and hemostasis in a single step, improving procedural efficiency and patient safety in soft-tissue surgeries.

The global Bipolar Plasma Resectoscope market size was estimated at USD 155.25 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.80% during the forecast period.
