### Report Overview

The fuel cell device is usually composed of multiple fuel cells that form a stack in series, thus increasing the total power. Each individual fuel cell consists of three main components: two electrodes (anode and cathode) and a conductive electrolyte. For PEM fuel cells, each electrode consists of a porous material with high specific surface area impregnated with an electro catalyst (usually platinum or platinum alloy). The electrolyte material is a polymer film and is used as an ionic conductor. Bipolar plate is a very important multi-functional component of PEMFCs (proton exchange membrane fuel cells). Its main function is to transport reaction gas to the membrane electrode through the flow field on the surface, collect and conduct current, and discharge reaction heat and product water.
