Abstracts

Bipolar plate coatings are specialized surface treatments applied to the metallic or graphite plates within fuel cells and electrolyzers, primarily to enhance corrosion resistance, reduce interfacial contact resistance, and improve electrical conductivity and durability under harsh operating conditions; these coatings, which often consist of materials like noble metals (e.g., gold), carbon-based layers, conductive polymers, or nitride/carbide ceramics, serve as protective barriers that prevent plate degradation, minimize power losses, and extend the operational lifespan of energy conversion devices such as proton exchange membrane fuel cells (PEMFCs) and solid oxide electrolysis cells (SOECs).

The global Bipolar Plate Coatings market size was estimated at USD 520.75 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 5.20% during the forecast period.
