Report Overview

A bipotentiostat is an advanced electrochemical instrument designed to control and measure the potential and current of two working electrodes simultaneously in a three-electrode system (working, counter, and reference electrodes). It is widely used in electrochemical research, corrosion studies, battery testing, biosensor development, and analytical chemistry applications where dual-electrode measurements are critical. The device enables precise potential application and current monitoring across two independent working electrodes, allowing researchers to study redox reactions, catalytic processes, and interfacial phenomena with high accuracy. Key features often include multi-channel control, synchronized data acquisition, and software integration for real-time analysis. The bipotentiostat market caters primarily to academic institutions, industrial R&D labs, and quality control facilities, driven by demand for more sophisticated electrochemical testing capabilities in energy storage, materials science, and biomedical research.
