Report Overview

Bismuth Vanadate (molecular formula BiVO_4), is an inorganic pigment, which imparts a range of greenish shades or greenish yellow shades. Bismuth vanadate exhibits characteristic properties such as high colour strength, high brightness, and high gloss among others. Bismuth vanadate is a non-hazardous inorganic pigment and is manufactured by dissolving bismuth nitrate with sodium vanadate and sodium molybdate in nitric acid, then by precipitation it produces complex mixture of metals. After calcination, it produces crystalline bismuth vanadate. Bismuth vanadate exhibits similar properties as that of other yellowish pigments such as lead chromate pigment. Growing demand for high performance pigments from the end use industries have resulted in increase in demand for pigments such as bismuth vanadate. Furthermore, regulations prevailing in developed regions such as North America and Europe over the use of lead chromate pigments are expected to in turn drive the demand for bismuth vanadate as an effective alternative. Moreover, the growing demand for bismuth vanadate from end use industries such as plastic and polymer, paint & coatings and others drive the global bismuth vanadate market. Increasing preference for environmentally friendly pigments in order to support the sustainable development are expected to bolster the growth of the global market for bismuth vanadate during the forecast period. Besides these, the higher cost of bismuth vanadate as compared to other alternative pigments, is expected to have a negative impact on the growth of the market.
