Abstracts

Bispecific antibody drugs are a sophisticated class of therapeutic agents engineered to simultaneously bind two distinct antigens or epitopes, enabling targeted immune cell engagement, dual pathway blockade, or enhanced payload delivery to specific cells. Unlike monoclonal antibodies that target a single antigen, bispecifics function as molecular bridges—for example, connecting T-cells directly to tumor cells (via CD3 and a tumor-associated antigen) to initiate a potent immune response independent of MHC recognition. Their modular design allows for tailored mechanisms of action, including T-cell recruitment, dual receptor inhibition, or conditional activation, making them particularly valuable in oncology, hematology, and autoimmune diseases where complex disease biology demands multi-target intervention. These therapeutics represent a significant advancement in precision medicine due to their ability to redirect immune effector functions, overcome resistance mechanisms, and achieve synergistic effects with improved specificity and reduced off-target toxicity.

The global Bispecific Antibody Drug market size was estimated at USD 6800.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 25.50% during the forecast period.
