Abstracts

A Bispectral Index (BIS) Monitor is a medical device used primarily in anesthesiology and critical care to measure a patient's level of consciousness during sedation or general anesthesia by analyzing electroencephalogram (EEG) signals. The monitor processes these signals to generate a numerical value, the BIS index, which ranges from 0 (indicating complete electrical silence in the brain) to 100 (representing full alertness), with values between 40 and 60 generally targeted for surgical anesthesia. This technology helps clinicians titrate anesthetic agents more precisely, reducing the risks of both under- and over-sedation, which can lead to intraoperative awareness or delayed recovery, thereby improving patient safety and optimizing drug usage.

The global Bispectral Index Monitor market size was estimated at USD 520.75 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 5.20% during the forecast period.
