### Report Overview

Bit error rate testers are usually designed for testing radio telemetry systems, synchronous serial communication equipment, and communication links. The high rate of penetration of broadband communication and sharp rise in demand of the access lines are driving the need of communication links with high transmission capacity and very low bit error rate. When some data is transmitted over a particular communication channel, there is a probability of errors being arrived into the system. BER tester identifies the error frequency and bit error rate (BER) over a communication channel for evaluating its overall performance, thereby improving the communication link quality and enabling network system to incorporate complete link characteristics.

Asia Pacific is anticipated to witness high growth potential in the global bit error rate testers market owing to the enormous telecommunications networks in the region. The dense amount of data transmission over the network in this region also contributes towards escalation of market growth. North America may also witness high market growth pertaining to large number of network providers and manufacturing companies across the region.
