Report Overview:

Black-body radiation thermometer is a thermometer which infers temperature from a portion of the thermal radiation sometimes called black-body radiation emitted by the object being measured. Black-body radiation thermometers gauge temperature based on the radiation released from an object. An object's ability to release radiation is called its emissivity—the more emissive an object is the more radiation a sensor has to work with. Sensors in this category include spot measuring devices that can produce 1-D and 2-D temperature readings, as well as thermal imaging thermometers which can display temperature data as a 2-D image.

The Global Black-Body Radiation Thermometer Market Size was estimated at USD 1504.12 million in 2023 and is projected to reach USD 2207.13 million by 2029, exhibiting a CAGR of 6.60% during the forecast period.
