Report Overview:

The Black Particles are produced by torrefaction or steam explosion, during which the water content, cellulose sugar and other volatile organic compounds are removed from the biomass to produce solid biofuels with similar characteristics to fossil coal. The main difference between the black particles and the standard wood particles is that the volume energy density of the black particles is 30% higher, the biodegradation is less, the transportation is safer and hydrophobic.

Black particles have excellent energy and processing quality, and are renewable, suitable for basic loading and dispatching according to needs, and will slowly replace coal products. The black particles are 100% biomass particles without additives, with excellent energy content and processing quality. It has unique water resistance and durability. The black particles are abrasion resistant, which can improve safety and reduce product loss during storage and transportation. As a waterproof solid fuel, unlike traditional "white" particles, it can be transported and stored outdoors like coal. Black particles have a higher energy density than white particles. This means that the transportation cost of each black particle is 30% lower than that of the white particle. Currently, black pellets are being sold to the coal-burning utility market. It can be stored outdoors, such as coal and co-fired, and the power generation can reach 100%.

The Global Black Particles Market Size was estimated at USD 110.90 million in 2023 and is projected to reach USD 244.71 million by 2029, exhibiting a CAGR of 14.10% during the forecast period.
