Report Overview

The black soldier fly is an insect belonging to the water snake family of the order Diptera, which originated in the savannah of South America and is distributed in most parts of the tropical, subtropical and temperate regions of the world. It is distributed in Guangdong, Guangxi, Hainan, Yunnan, Sichuan, Fujian, Hebei, Beijing and other regions in my country. Its growth and development are divided into egg stage, larval stage, pupal stage and adult stage, and it is a complete metamorphosis insect. The larval stage can be divided into 6 different instars. The body changes from white to black. The larvae of the sixth instar are called prepupa. The black soldier fly enters the static stage at low temperature and grows fast at a constant temperature of 27.8 °C. After the larval stage is completed, the larvae are saprophytic and eat a wide range of foods. They can use kitchen waste and livestock and poultry manure as their food source. The formed pupae are rich in crude protein and crude fat. Black soldier fly pre-larvae and pre-pupae have very high nutritional value and are rich in essential amino acids and minerals. In production practice, it is difficult to collect black soldier fly larvae, but when the larvae form the pre-pupation stage, they need to find a place to pupate, and they will crawl out of the feeding substrate, so it is easier to collect pre-pupation than larvae at this stage. Feeding the larvae produced by the black soldier fly with different feces will slightly use the nutrients. Overall, black soldier fly larvae contain 42% to 43% of dry matter, of which the crude protein content in dry matter reaches 42.00% to 44.00%, the crude fat content is 31.00% to 35.00%, and the calcium content is 4.80% to 5.10%. , the phosphorus content is 0.60%~0.63%. According to the data of Yu Guohui et al., Table 7 is a comparison table of the nutritional content of black soldier fly larvae powder and prechrysalis powder fed with pig manure and the nutritional value of fish meal. It can be seen that the content of crude protein and nitrogen-free extract of

black soldier fly larva powder is lower than that of fish meal, the content of crude fat and crude fiber is higher than that of fish meal, and the content of crude ash is also higher. In the dry matter of the black soldier fly prechrysalis powder, the crude protein content was 43.2%, and the crude fat and crude fiber contents were higher than those of fishmeal.
