Abstracts

Bladeless optical trocars are specialized surgical instruments used in minimally invasive procedures, primarily in laparoscopy, which employ a blunt, non-cutting tip combined with an integrated optical system to allow direct visualization during insertion; this design aims to reduce the risk of complications such as organ injury or bleeding by eliminating the need for a sharp blade while providing real-time visual feedback to the surgeon. These devices typically feature a transparent tip and are often coupled with a laparoscope or camera system, enabling precise and controlled entry into the abdominal cavity without the traditional incision method associated with conventional sharp trocars.

The global Bladeless Optical Trocars market size was estimated at USD 350.28 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.85% during the forecast period.
