Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Block Copolymer Electrolytes competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Block Copolymer Electrolytes are a class of solid polymer electrolytes formed by linking two or more distinct polymer segments (blocks) in a linear sequence. These blocks are chemically different and typically exhibit phase separation on the nanoscale, leading to well-organized microstructures such as lamellae, cylinders, or gyroids. One block usually provides mechanical strength (e.g., polystyrene), while the other offers ionic conductivity (e.g., polyethylene oxide or PEO). The phase-separated morphology allows for a balance of mechanical robustness and ion transport efficiency, making block copolymer electrolytes promising candidates for lithium-ion and next-generation solid-state batteries. Their tunability via block length, composition, and architecture enables precise control over ionic conductivity, mechanical integrity, and thermal stability.

The global Block Copolymer Electrolytes market size was estimated at USD 137.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 12.80% during the forecast period.
