Abstracts

Block and bleed manifolds are specialized valve systems used in industrial process control and instrumentation to isolate, block, and bleed pressure from process lines, primarily for maintenance, calibration, or safety purposes in industries such as oil and gas, chemical processing, power generation, and water treatment. These devices typically consist of a combination of block valves (to isolate fluid flow) and bleed valves (to vent or drain residual pressure), integrated into a single compact unit that minimizes potential leak points, ensures operational safety, and enhances system reliability by allowing safe access to instruments like pressure gauges, transmitters, or sensors without requiring a full system shutdown.
