## Abstracts

Blockchain technology, with its decentralized, immutable, and transparent characteristics, has emerged as a promising solution to address critical challenges in healthcare data security, such as data breaches, unauthorized access, fragmented records, and privacy concerns. Unlike traditional centralized databases (e.g., hospital servers), healthcare data on a blockchain is distributed across a network of nodes (e.g., hospitals, clinics, research institutions). No single entity controls the data, reducing the risk of a single point of failure or a large-scale breach. Once data is recorded on a blockchain, it cannot be altered or deleted without consensus from the network. Each transaction (e.g., a medical record update) is linked to the previous one via cryptographic hashes, creating a tamper-proof audit trail.

The global Blockchain for Healthcare Data Security market size was estimated at USD 1492.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 15.30% during the forecast period.
