Abstracts

Blockchain in edge computing represents the integration of distributed ledger technology with decentralized computing architectures, where data processing and storage occur closer to the source of data generation?such as IoT devices, sensors, or local networks?rather than relying solely on centralized cloud servers. This convergence enhances data integrity, security, and transparency through immutable, cryptographically secured records while reducing latency and bandwidth usage by minimizing the need for constant data transmission to distant data centers. By enabling trustless, peer-to-peer transactions and automated smart contract execution at the network edge, this synergy supports applications requiring real-time decision-making, such as autonomous systems, supply chain tracking, and secure federated learning, without compromising on auditability or resilience against tampering.

The global Blockchain In Edge Computing market size was estimated at USD 520.75 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 5.20% during the forecast period.
