Abstracts

Blockchain in security refers to the application of distributed ledger technology (DLT) to enhance cybersecurity by providing decentralized, tamper-proof, and transparent mechanisms for securing data, identity, and transactions. Unlike traditional centralized systems vulnerable to single points of failure, blockchain employs cryptographic hashing, consensus protocols, and immutable record-keeping to ensure data integrity, authentication, and auditability. Its utility spans areas such as secure identity management, supply chain verification, fraud prevention, and decentralized authentication systems, leveraging features like smart contracts to automate security protocols without intermediaries. This technology fundamentally redefines trust in digital interactions by shifting reliance from centralized authorities to cryptographically enforced, distributed networks.

The global Blockchain In Security market size was estimated at USD 10580.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 18.50% during the forecast period.
