### Report Overview:

Blocked isocyanate refers to a compound prepared by blocking a blocked group of isocyanate groups (-NCO) by a deblocking reaction that cannot be carried out at a lower temperature. This compound does not undergo polymerization at room temperature, but at a certain temperature and other conditions, the isocyanate groups in the blocked polyurethane can be regenerated, and a crosslinking reaction occurs to form a thermosetting polyurethane. The isocyanate group is blocked by reacting an isocyanate or a prepolymer containing a free isocyanate group with some active hydrogen-containing substance or a substance capable of reacting with an isocyanate group, so that the free isocyanate group is not reactive at normal temperature, that is, isocyanate is achieved. The base is closed. This blocking reaction is a reversible reaction under certain conditions, so that the blocked isocyanate group can function again.

The Global Blocked Isocyanate Market Size was estimated at USD 347.30 million in 2023 and is projected to reach USD 592.14 million by 2029, exhibiting a CAGR of 9.30% during the forecast period.
