### Report Overview:

A stroke is a sudden loss of blood circulation in an area of the brain which may result in loss of neurological functioning. Strokes are generally of three types Ischemic Stroke (caused due to blood clots), Hemorrhagic stroke (caused when there is a rupture in arteries) and lastly transient ischemic attack (caused when blood flow to the brain is blocked for a short time). In early 1980's the blood clot retrieval devices used for endovascular revascularization were based on intra-arterial and selective thrombolytic agents. Another methodology proposed was the use of a combination of intra-arterial thrombolytic and use of ultrasound to disrupt the clot. The clot retrieval process is performed within eight hours of the onset of stroke symptoms, the whole process of blood clot retrieval takes about two hours.

The Global Blood Clot Retrieval Devices Market Size was estimated at USD 715.24 million in 2023 and is projected to reach USD 1586.52 million by 2029, exhibiting a CAGR of 14.20% during the forecast period.
