Report Overview:

Blowout Preventer (BOP) is a safety device used to "prevent" the uncontrolled flow of liquids and gases during well drilling operations.

Blowout preventers are large, high-pressure valves that are capable of being remotely controlled. When the driller closes the valve, a pressure-tight seal is formed at the top of the well, preventing the fluids from escaping. There are two major types of Blowout Preventers, Annular BOP and Ram BOP. Annular BOPs are usually mounted to the very top of the BOP stack. The drilling crew then mounts two, three, or four RAM BOPs below the Annular preventer. If a kick is detected, the annular is usually closed first and then the RAM is used as a backup if the Annular should fail.

Blowout preventers are used on land wells, offshore rigs, and subsea wells. Land and subsea BOPs are secured to the top of the wellbore, known as the wellhead. BOPs on offshore rigs are mounted below the rig deck. Subsea BOPs are connected to the offshore rig above by a drilling riser that provides a continuous pathway for the drill string and fluids emanating from the wellbore.

The Global Blowout Preventer (BOP) Equipment Market Size was estimated at USD 7432.77 million in 2023 and is projected to reach USD 9083.94 million by 2029, exhibiting a CAGR of 3.40% during the forecast period.
