Abstracts

Blue Enhanced Si Photodiodes are semiconductor devices optimized for high sensitivity in the blue and ultraviolet spectral ranges, typically from 200 nm to 600 nm, achieved through specialized fabrication processes such as shallow junction design and anti-reflective coatings that enhance quantum efficiency in shorter wavelengths. These photodiodes convert light into electrical current with improved performance in low-light conditions and are critical in applications requiring precise detection of blue/UV light, including biomedical instrumentation, environmental monitoring, fluorescence analysis, and astronomical sensors. Their defining characteristics include low dark current, fast response times, and enhanced spectral responsivity in the blue-UV region, distinguishing them from standard silicon photodiodes which peak in sensitivity around the near-infrared spectrum.

The global Blue Enhanced Si Photodiode market size was estimated at USD 180.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.80% during the forecast period.
