Report Overview:

Laser diodes are electrically pumped semiconductor lasers in which the gain is generated by an electrical current flowing through a p–n junction or (more frequently) a p–i–n structure. In such a heterostructure, electrons and holes can recombine, releasing the energy portions as photons. This process can be spontaneous, but can also be stimulated by incident photons, in effect leading to optical amplification, and with optical feedback in a laser resonator to laser oscillation. A blue laser diode emits electromagnetic radiation with a wavelength between 405 and 483 nanometres, which the human eye sees as blue or violet.

This report includes the Blue Laser Diode wavelength (405NM~483NM) and it don't includes the data of Blue Laser Diode module or Blue Diode Laser.

The Global Blue Laser Diodes Market Size was estimated at USD 269.32 million in 2023 and is projected to reach USD 375.59 million by 2029, exhibiting a CAGR of 5.70% during the forecast period.
