Abstracts

Blue light emitting diodes (LEDs) are semiconductor devices that emit light in the blue wavelength range, typically between 450 and 495 nanometers, when an electric current is applied. They are based on gallium nitride (GaN) and indium gallium nitride (InGaN) materials, which enable efficient conversion of electrical energy into high-intensity blue light. These components are integral to a wide array of applications, including full-color displays (where they serve as a primary color alongside red and green LEDs), backlighting for LCD screens in televisions, monitors, and smartphones, general and architectural lighting (often in combination with phosphors to produce white light), automotive lighting (such as headlights and indicators), and various signaling, medical, and horticultural uses. Their development marked a critical milestone in solid-state lighting, as blue LEDs were essential for creating energy-efficient white light sources and advancing display technologies, contributing significantly to reductions in power consumption and enabling new design possibilities across multiple industries.

The global Blue Light Emitting Diodes market size was estimated at USD 4500.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 8.50% during the forecast period.
