Gasified LNG by inevitable heat input from external area is referred to as boil off gas (BOG). BOG is conventionally pressurized with compressor and then sent as city gas or fuel for power generation together with LNG gas vaporized by heat exchanger. BOG re-liquefaction technology using LNG cold energy has been established as one of other gas treatment methods. In case of gas supposed to be sent as city gas or fuel for power generation, gas pressure reaches 30 to 90 barG while pressure of BOG going to re-liquefaction facility is lower than 10 barG. Therefore, addition of re-liquefaction facility decreases the size of BOG compressor to reduce operational power, which leads to energy conservation. Boil-off gas reliquefaction system is a technical system for converting gas into liquid. It is usually used in situations where gas needs to be stored or transported, such as industrial production, refrigeration, liquefied natural gas and other fields. The basic principle of the evaporated gas reliquefaction system is to convert the gas into liquid by controlling the temperature and pressure to make the gas undergo two processes of evaporation and condensation. First, the pressure of high-pressure gas is reduced through devices such as pressure reducing valves, which in turn causes the temperature to drop, causing part of the gas to evaporate and form saturated steam. The vapor is then cooled through equipment such as a condenser so that its temperature drops below the critical temperature of the gas, allowing the vapor to gradually transform into a liquid. Finally, the liquid is separated from the gas through a device such as a separator and stored or further processed. The evaporation gas reliquefaction system usually includes key components such as compressors, condensers, evaporators, and separators. Through the cooperation and control of these components, the evaporation and condensation process of gas is realized, and the goal of gas reliquefaction is achieved. This kind of system has important applications in the industrial and energy fields, enabling efficient storage and transportation of gas and improving energy efficiency.
