Abstracts

A boiler blowdown valve is a critical safety and efficiency component in steam boiler systems, designed to periodically discharge a controlled volume of water from the boiler to remove accumulated dissolved solids, sludge, and impurities that concentrate during the evaporation process. This process, known as blowdown, helps prevent scale formation, corrosion, and foaming, which can impair heat transfer efficiency, increase fuel consumption, and pose risks such as overheating or pressure vessel failure. These valves are typically automatic or manually operated and must meet stringent pressure and temperature ratings, often constructed from materials like stainless steel or forged carbon steel to withstand harsh operating conditions. Their proper function is essential for maintaining boiler performance, extending equipment lifespan, and ensuring operational safety in compliance with industry standards.

The global Boiler Blowdown Valves market size was estimated at USD 152.3 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.15% during the forecast period.
