Abstracts

A boiler compound feeder is a specialized industrial device designed to automatically and precisely introduce water treatment chemicals, known as boiler compounds or conditioning agents, into boiler feedwater systems to prevent scale formation, corrosion, and foaming. These compounds typically include phosphates, sulfites, amines, or polymers that help maintain water chemistry within optimal parameters, ensuring efficient heat transfer, prolonging equipment lifespan, and reducing energy consumption. The feeder functions by metering and injecting predetermined amounts of these chemicals into the water stream, either continuously or at set intervals, and is often integrated with sensors and controllers to adjust dosing based on real-time water quality measurements, making it a critical component for operational safety and regulatory compliance in steam-generating systems across industries such as power generation, manufacturing, and hospitality.

The global Boiler Compound Feeder market size was estimated at USD 85.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 3.50% during the forecast period.
