Abstracts

Boiler continuous blowdown valves are specialized valves used to regulate and remove dissolved solids, impurities, and sediments from a boiler system in a controlled manner. They help maintain water quality, prevent scaling and corrosion, and improve boiler efficiency by continuously discharging a small amount of concentrated water while allowing fresh feedwater to enter. These valves are essential in high-pressure steam boilers, where maintaining proper water chemistry is critical to system performance and longevity. By controlling the rate of blowdown, they optimize energy use, reduce water wastage, and extend the life of the boiler.

The global Boiler Continuous Blowdown Valves market size was estimated at USD 568.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.90% during the forecast period.
