Report Overview

Usually, we utilize certain apparatus for generating Electricity. In that, a boiler plays an important role. For the appropriate function of the boiler & in order to evade corrosion in the boiler, the deaerator is used. It is an appliance used for the removal of carbon dioxide, oxygen, and other gases. These gases are available in the feed water fed to the boiler. To avoid the corrosion due to these gases in the boiler deaerator is used. The removal of these dissolved gases increases the efficiency and life expectancy of the boiler. There are three types of deaerator. They are Spray Type, Tray Type, and Vacuum Type. Spray Type deaerator is a cylindrical vessel used for the removal of dissolved gases from the feed water. Basically, the removal of dissolved gases is done by either decreasing the pressure or increasing the temperature inside the deaerator. The feed water fed into the deaerator will pass on through the vented section where the water will experience high steam which allows the feed water to remove dissolved gases. Tray type deaerator is a vertical dome placed on the horizontal section of the vessel. The basic difference between a tray-type and spray type is in Tray type both a spray nozzle and trays are used. By using both spray and tray mixing up of air and water is more (heat exchange takes place more properly). By this, the dissolved gases present in the feed water will be eliminated more precisely. The operation of vacuum type is the same as that of a tray-type but a vacuum pump is used at the air vent. This is used to minimize the vent losses. By minimizing vent losses the efficiency of the boiler can be increased.

The global Boiler Deaerators market size was estimated at USD 3250 million in 2023 and is projected to reach USD 4363.89 million by 2030, exhibiting a CAGR of 4.30% during the forecast period.
