Abstracts

Boiler fireside chemicals refer to a class of chemical reagents specifically designed for internal treatment and maintenance of boiler furnace sides. During boiler operation, due to high-temperature combustion and impurities in fuel, the furnace interior is prone to problems such as ash deposition, slagging, and corrosion, which not only reduce boiler thermal efficiency but may also pose a threat to safe operation. Boiler fireside chemicals, with their special chemical compositions, can effectively prevent or reduce the formation of ash deposition and slagging while protecting furnace metals from high-temperature corrosion. These chemicals may include cleaners, antiscaling agents, antioxidants, and corrosion inhibitors. They are regularly added to the boiler furnace or introduced into the boiler with fuel, effectively maintaining the internal cleanliness and safety of the boiler, extending its lifespan, and improving thermal efficiency and operational reliability.

The global Boiler Fireside Chemicals market size was estimated at USD 754.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.10% during the forecast period.
