Abstracts

Boiling water reactors (BWRs) are a type of nuclear reactor in which water serves as both the coolant and the moderator, with the primary distinguishing feature being that the water is allowed to boil directly in the reactor core to produce steam, which then drives the turbine generators for electricity production. Unlike pressurized water reactors (PWRs), BWRs operate at lower pressures and do not require a separate steam generator, simplifying the design but introducing specific operational and safety considerations related to direct steam production and radiological control.

The global Boiling Water Reactors market size was estimated at USD 3500.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 2.50% during the forecast period.
