## Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Bolt-on Anodes competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. A bolt-on anode is a type of sacrificial anode designed for corrosion protection, featuring a mechanical attachment mechanism via bolts, nuts, or fasteners rather than welding. These anodes consist of a sacrificial metal body (typically zinc, aluminum, or magnesium) paired with a mounting bracket or flange, allowing them to be securely fastened to metal structures. The design prioritizes ease of installation and replacement, making it ideal for applications where welding is impractical, such as on painted surfaces, heat-sensitive materials, or structures that require non-destructive attachment. Bolt-on anodes are commonly used in marine environments, industrial equipment, or infrastructure where periodic maintenance or anode replacement is necessary, as their removable design eliminates the need for specialized welding tools and minimizes damage to the protected structure during installation.

The global Bolt-on Anodes market size was estimated at USD 339.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.20% during the forecast period.
