Abstracts

A bomb disposal suit, also known as an Explosive Ordnance Disposal (EOD) suit or a bomb suit, is a specialized protective clothing worn by bomb disposal technicians while handling or defusing explosive devices. The primary purpose of the suit is to provide maximum protection to the wearer against the potential blast, fragmentation, and thermal effects of an explosion. The bomb disposal suit is typically made of multiple layers of high-strength materials such as Kevlar, ballistic nylon, and other synthetic fibers. These materials are designed to absorb and disperse the impact of a blast, as well as protect against shrapnel and other projectiles. The suit usually consists of a helmet with a visor, a heavily padded jacket or vest, arm and leg protectors, gloves, and boots. The helmet is equipped with a face shield and a communication system to allow the wearer to communicate with their team. The suit may also have additional features like cooling systems to prevent heat buildup and provide comfort to the wearer during long operations. Bomb disposal suits are designed to be highly durable and provide a high level of protection, but they do have limitations. They can only withstand a certain level of blast and fragmentation, and there is always a risk of injury or death when dealing with explosive devices. Therefore, bomb disposal technicians undergo extensive training and follow strict protocols to minimize the risks associated with their work.

The global Bomb Disposal Suit market size was estimated at USD 1276.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.10% during the forecast period.
