Abstracts

Bonded neodymium iron boron (NdFeB) magnets are a category of permanent magnets produced by combining fine NdFeB powder with a polymer binder, such as epoxy or nylon, and then shaping the mixture via compression or injection molding before curing. This manufacturing process allows for the creation of magnets with complex geometries, tight tolerances, and isotropic magnetic properties, meaning their magnetic orientation is uniform in all directions. Unlike their sintered counterparts, which are brittle and difficult to machine into intricate shapes, bonded NdFeB magnets offer superior design flexibility, corrosion resistance without additional coating, and reduced eddy current losses, making them particularly suitable for applications requiring high precision, miniaturization, and high-frequency operation, such as in sensors, micro-motors, hard disk drives, and automotive systems. However, they generally exhibit lower magnetic energy product (BH_{max}) and operating temperature limits compared to sintered NdFeB magnets, representing a trade-off between performance and manufacturability.

The global Bonded Nd Fe B Magnets market size was estimated at USD 2043.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 8.75% during the forecast period.
