Abstracts

In the field of semiconductor packaging and microelectronic manufacturing, bonders and bonding wires are core equipment and materials that enable the electrical connection between "chips and external circuits". Working in synergy, they directly determine the reliability, performance, and cost of electronic devices. A bonder is a high-precision automated device. Its core function is to "bond" the two ends of a bonding wire to the chip's "pads" and external packaging leads (Lead Frame) or substrates (Substrate) respectively through physical/chemical actions. This process forms a stable electrical path while achieving mechanical fixation and heat conduction. A bonding wire is an ultra-fine metal wire used to connect chips to external circuits. It serves not only as a "bridge" for electrical signal transmission but also as a channel for heat conduction. The material, diameter, and purity of bonding wires directly affect the conductivity, fatigue resistance, and reliability of the connection. Both bonders and bonding wires belong to the core supply chain of the semiconductor packaging process. They maintain a collaborative "equipment-consumable" relationship, jointly serving downstream packaging factories while relying on upstream suppliers of raw materials and core components. In 2024, global Bonder production reached approximately 10,403 units, with an average global market price of around k US\$ 247.25 per unit. In 2024, global Bonding Wires production reached approximately 4,928.52 Million Meters, with an average global market price of around US\$ 543.47 per Meters.

The global Bonder and Bonding Wires market size was estimated at USD 5251.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.40% during the forecast period.
