Report Overview

Bonding wire is used as an interconnect material for a semiconductor package. It is a thin metal wire to carry electric signals from a semiconductor to an external part.

Semiconductors are used in various kinds of stuff that support our daily life from PCs, home appliances, and to automobiles. In general, a semiconductor package is sealed with a mold resin after wire bonding process, thus bonding wire is not seen from outside. Gold, silver, copper, and aluminum are used as a material for bonding wire.

Gold had been almost exclusively used for ball bonding process, but the invention of palladium coated copper (PCC) wire (EX wire) has changed the dynamics of bonding wire market in the early 2010s. Now the PCC wire is the most widely used material in the market. In recent years, the use of silver wire is also increasing in various types of package application as an alternative to gold wire. Aluminum wire is mainly used for wedge bonding process mainly for power semiconductors.

The global Bonding Wire For Semiconductor Packaging market size was estimated at USD 3192.45 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.85% during the forecast period.
